

CBT Skill Acquisition: RDAP (Men)

Background

Interactive Journaling[®] is an evidence-based process rooted in a cognitive-behavioral approach. Though several theories exist to describe why people improve as a result of participating in a CBT-based program, the acquisition of particular skills related to cognitive restructuring and behavioral activation scores are two factors that consistently predict behavior change.

With a foundation in cognitive-behavioral therapy, The Change Companies[®]' RDAP curriculum is designed to help participants learn how to make lasting change in substance use behaviors.

Description

The CBTSA: RDAP (Men) instrument is a 43-item, self-report questionnaire that measures current CBT skills use among men participating in a residential drug treatment program. It is designed to be completed by participants at two time points: prior to beginning the program and following completion of the program. It is estimated that it will take approximately 15 minutes for people to complete this paper-pencil measure.

This measure is a modified version of the Cognitive-Behavioral Therapy Skills Questionnaire (CBTSQ), an instrument with sound psychometric properties, including good overall internal consistency (overall: $\alpha = .91$; BA: $\alpha = .85$; CR: $\alpha = .88$). A validation study (Jacob, Christopher and Neuhaus, 2011) reported expected correlations with a variety of constructs among a large sample of patients receiving intensive CBT in a partial hospital setting.

There are three factors measured by this instrument:

Behavioral Activation (BA: 7 items),
Cognitive Restructuring (CR: 9 items),
RDAP (Men) series objectives (RDAP-M: 36 items)

Scoring

Sum the responses for each factor to compute a factor score:

Behavioral Activation items = 1 4 5 9 10 11 13
Cognitive Restructuring items = 2 3 6 7 8 12 14 15 16
RDAP (Men) series objectives = 17-43 (sequential)

Scoring can be further broken down by the nine journals comprising RDAP men's series to create subscales of specific journal objectives:

Community: 17-19
Opportunity to Change: 20-22
The ABCs of Thinking: 23-25
Rational Self-counseling: 26-28
Challenging Thinking: 29-31
Prosocial Lifestyle: 32-34
Connecting with Others: 35-37
Strategies for Success: 38-40
Moving Forward: 41-43

BA factor scores range from 0 to 35, and higher scores indicate greater use of BA skills.

CR factor scores range from 0 to 45, and higher scores indicate greater use of CR skills.

RDAP (Men) series objectives scores range from 0 to 135, with higher scores indicating greater understanding and application of Journal content.

RDAP (Men) series Journal-specific subscale scores range from 0 to 15, with higher scores indicating greater understanding and application of specific journal content.

CBT Skill Acquisition: RDAP (Men)

Data Entry and Analysis

To understand changes in scores in participants completing the program, the appropriate statistical test is a paired t-test. A paired t-test measures whether means from a within-subjects test group vary prior to and after being exposed to the RDAP (Men) curriculum.

We recommend you store participant summary data at an item level (i.e., with all 43 items individually entered to allow computation of factor scores, Journal specific scores and total scores) in an electronic spreadsheet, assigning participants a unique ID and storing data without identifying information for HIPAA compliance reasons. Note that in order to complete this analysis you must have matched data, meaning the same identifier must be used for participants at each time point.

Train for Change Inc.® offers comprehensive evaluation and reporting packages. Please contact us for further information.

Reporting Scores Sample

A paired-samples t-test was conducted to compare pre- and post-test scores for (n=xx) people participating in our program that utilized The Change Companies®' RDAP (Men) curriculum. There was a significant/not a significant) difference in pretest scores (M=___, SD=___) and post-test scores (M=___, SD=___); $t(_) = _$, $p = _$.
